

1A $\mathbb{R}^n$ and $\mathbb{C}^n$

1.1 definition: complex numbers, $\mathbb{C}$

- A complex number is an ordered pair (a, b) , where $a, b \in \mathbb{R}$, but we will write this as $a + bi$. $\mathbb{R}$
- The set of all complex numbers is denoted by $\mathbb{C}$:

$$\mathbb{C} = \{a + bi : a, b \in \mathbb{R}\}.$$

- Addition and multiplication on $\mathbb{C}$ are defined by

$$\begin{aligned}(a + bi) + (c + di) &= (a + c) + (b + d)i, \\ (a + bi)(c + di) &= (ac - bd) + (ad + bc)i;\end{aligned}$$

here $a, b, c, d \in \mathbb{R}$.

$$\underline{i^2 = -1}$$

$$\begin{aligned}(a + bi)(c + di) &= a(c + di) + bi(c + di) \\ &= ac + adi + bci + bdi^2 \\ &= (ac - bd) + (ad + bc)i\end{aligned}$$

1.3 properties of complex arithmetic

commutativity

$$\underline{\alpha + \beta = \beta + \alpha} \text{ and } \underline{\alpha\beta = \beta\alpha} \text{ for all } \alpha, \beta \in \mathbb{C}.$$

associativity

$$\underline{(\alpha + \beta) + \lambda = \alpha + (\beta + \lambda)} \text{ and } \underline{(\alpha\beta)\lambda = \alpha(\beta\lambda)} \text{ for all } \alpha, \beta, \lambda \in \mathbb{C}.$$

identities

$$\underline{\lambda + 0 = \lambda} \text{ and } \underline{\lambda 1 = \lambda} \text{ for all } \lambda \in \mathbb{C}.$$

additive inverse

$$\text{For every } \underline{\alpha \in \mathbb{C}}, \text{ there exists a unique } \underline{\beta \in \mathbb{C}} \text{ such that } \underline{\alpha + \beta = 0}.$$

multiplicative inverse

$$\text{For every } \alpha \in \mathbb{C} \text{ with } \underline{\alpha \neq 0}, \text{ there exists a unique } \underline{\beta \in \mathbb{C}} \text{ such that } \underline{\alpha\beta = 1}.$$

distributive property

$$\underline{\lambda(\alpha + \beta) = \lambda\alpha + \lambda\beta} \text{ for all } \lambda, \alpha, \beta \in \mathbb{C}.$$

1.5 definition: $-\alpha$, subtraction, $1/\alpha$, division

Suppose $\alpha, \beta \in \mathbb{C}$.

- Let $-\alpha$ denote the additive inverse of α . Thus $-\alpha$ is the unique complex number such that

$$\underline{\alpha + (-\alpha) = 0}.$$

- Subtraction on $\mathbb{C}$ is defined by

$$\beta - \alpha = \beta + (-\alpha).$$

- For $\alpha \neq 0$, let $1/\alpha$ and $\frac{1}{\alpha}$ denote the multiplicative inverse of α . Thus $1/\alpha$ is the unique complex number such that

$$\underline{\alpha(1/\alpha) = 1}.$$

- For $\alpha \neq 0$, division by α is defined by

$$\underline{\beta/\alpha = \beta(1/\alpha)}.$$

For $\alpha \in \mathbb{C}$ and m a positive integer, we define $\underline{\alpha^m}$ to denote the product of α with itself m times:

$$\underline{\alpha^m} = \underbrace{\alpha \cdots \alpha}_{m \text{ times}}.$$

Definition

Definition 1 (Field)

A **field** is a set $\mathbb{F}$ equipped with two binary operations (usually written as addition and multiplication) such that:

1. Addition and multiplication are associative: $\forall a, b, c \in \mathbb{F}$, we have

$$\begin{aligned} \underline{a} + (\underline{b} + \underline{c}) &= (\underline{a} + \underline{b}) + \underline{c} \\ (\underline{a} \underline{b}) \underline{c} &= \underline{a} (\underline{b} \underline{c}) \end{aligned}$$

2. Addition and multiplication commute: $\forall a, b, c \in \mathbb{F}$, we have

$$\begin{aligned} \underline{a} + \underline{b} &= \underline{b} + \underline{a} \\ \underline{a} \underline{b} &= \underline{b} \underline{a} \end{aligned}$$

3. There exist distinct additive and multiplicative identities in $\mathbb{F}$:

$$\begin{aligned} \exists \underline{1} \in \mathbb{F} \text{ such that } \underline{1} \underline{a} &= \underline{a} \quad \forall \underline{a} \in \mathbb{F} \\ \exists \underline{0} \in \mathbb{F} \text{ such that } \underline{a} + \underline{0} &= \underline{a} \quad \forall \underline{a} \in \mathbb{F} \end{aligned}$$

The distinctness requirement here means that $\underline{0} \neq \underline{1}$.

4. Additive and multiplicative inverses exist in $\mathbb{F}$:

$$\begin{aligned} \forall \underline{a} \in \mathbb{F}, \exists (-\underline{a}) \in \mathbb{F} \text{ such that } \underline{a} + (-\underline{a}) &= \underline{0} \\ \forall \underline{a} \neq \underline{0} \in \mathbb{F}, \exists \underline{a}^{-1} \in \mathbb{F} \text{ such that } \underline{a} \underline{a}^{-1} &= \underline{1} \end{aligned}$$

5. Multiplication is distributive over addition:

$$\underline{a} (\underline{b} + \underline{c}) = \underline{a} \underline{b} + \underline{a} \underline{c}$$

$$\begin{aligned} \mathbb{F} &= \{e\} \\ e + e &= e \\ e \cdot e &= e \end{aligned}$$

Definition

Definition 2 ($\mathbb{F}^n$)

For n a positive integer, we define:

$$\mathbb{F}^n = \{(\underline{x}_1, \dots, \underline{x}_n) : \underline{x}_i \in \mathbb{F}\}$$

Where the addition is component-wise.

Example

Example 3

Here is an example of addition in $\mathbb{F}^n$.

$$(\underline{x}_1, \dots, \underline{x}_n) + (\underline{y}_1, \dots, \underline{y}_n) = (\underline{x}_1 + \underline{y}_1, \dots, \underline{x}_n + \underline{y}_n)$$

What about multiplication? Can we define $(\underline{x}_1, \dots, \underline{x}_n)(\underline{y}_1, \dots, \underline{y}_n) = (\underline{x}_1 \underline{y}_1, \dots, \underline{x}_n \underline{y}_n)$?

Sure, but we lose a nice property!

mainly, multiplicative inverses: $\exists \underline{x}_i (0, \underline{x}_2, \dots, \underline{x}_n)$ does not have a multiplicative inverse! Even when $\underline{x}_i \neq 0$ for some $i \in \{2, \dots, n\}$ i.e. we have some $\underline{x} \neq \underline{0}$ with no inverse wrt multiplication!

Notation

Notation 4

In $\mathbb{F}^n$, we let $\underline{0}$ denote the element $(0, 0, \dots, 0) \in \mathbb{F}^n$, and for $\underline{x} \in \mathbb{F}^n$, we let $(-\underline{x})$ denote the additive inverse of $\underline{x}$ -i.e., the element $(-\underline{x}) \in \mathbb{F}^n$ such that $\underline{x} + (-\underline{x}) = \underline{0}$.

Definition

Definition 5 (Scaling)

For $\lambda \in \mathbb{F}$, define $\lambda \underline{x}$ for $\underline{x} \in \mathbb{F}^n$ to be:

$$\lambda \underline{x} = (\lambda \underline{x}_1, \dots, \lambda \underline{x}_n) \in \mathbb{F}^n$$

1B Definition of Vector Space

1.19 definition: addition, scalar multiplication

- An addition on a set V is a function that assigns an element $u + v \in V$ to each pair of elements $u, v \in V$.
- A scalar multiplication on a set V is a function that assigns an element $\lambda v \in V$ to each $\lambda \in \mathbf{F}$ and each $v \in V$.

1.20 definition: vector space

A vector space is a set V along with an addition on V and a scalar multiplication on V such that the following properties hold.

commutativity

$u + v = v + u$ for all $u, v \in V$.

associativity

$(u + v) + w = u + (v + w)$ and $(ab)v = a(bv)$ for all $u, v, w \in V$ and for all $a, b \in \mathbf{F}$.

additive identity

There exists an element $0 \in V$ such that $v + 0 = v$ for all $v \in V$.

additive inverse

For every $v \in V$, there exists $w \in V$ such that $v + w = 0$.

multiplicative identity

$1v = v$ for all $v \in V$.

distributive properties

$a(u + v) = au + av$ and $(a + b)v = av + bv$ for all $a, b \in \mathbf{F}$ and all $u, v \in V$.

different +'s!

1.21 definition: vector, point

Elements of a vector space are called vectors or points.

Example

$\mathbb{F}^n$ is a vector space for any field $\mathbb{F}$. If you take $\mathbb{F}^\infty$ to be all sequences of elements in $\mathbb{F}$, then so is $\mathbb{F}^\infty$.

Notation

For a set S and field $\mathbb{F}$, $\mathbb{F}^S$ denotes the set of all functions from S to $\mathbb{F}$.

Example

If we define $(f + g)(x) = f(x) + g(x)$ and $(\lambda f)(x) = \lambda(f(x))$ for all $f, g \in \mathbb{F}^S$ and $\lambda \in \mathbb{F}$, then $\mathbb{F}^S$ is a vector space.

Similar!

Notice: A function $f \in \mathbb{F}^S$ w/ $S = \{1, \dots, n\}$ is basically just a list $(x_1, \dots, x_n)$

i.e. $f(i) = x_i$. Taking $S = \{1, \dots\}$ we get $\mathbb{F}^\infty$ too!

Proof

Let $0, 0' \in V$ be two additive identities. Then,

$$\rightarrow 0 + x = x \text{ and } 0' + x = x$$

for all $x \in V$. So,

$$\begin{aligned} 0' &= 0 + 0' \\ &= 0' + 0 \\ &= 0. \end{aligned}$$

commutativity!

Every element in a vector space has a unique additive inverse.

Proof Let V be a vector space & let $v \in V$.

& w, w' are two additive inverses of v . Then:

$$\begin{aligned} w &= w + 0 \\ &= w + (v + w') \\ &= (w + v) + w' \\ &= 0 + w' \\ &= w'. \end{aligned}$$

Therefore, additive inverses are unique.

1.28 notation: $-v$, $w - v$

Let $v, w \in V$. Then

- $-v$ denotes the additive inverse of v ;
- $w - v$ is defined to be $w + (-v)$.

1.30 the number 0 times a vector

$0v = 0$ for every $v \in V$.

Proof

$$0v = (0+0)v = 0v + 0v$$

$$\begin{aligned} \text{So, } 0 &= 0v + (-0v) \leftarrow \text{Def'n of additive inverses} \\ &= (0v + 0v) + (-0v) \\ &= 0v + (0v + (-0v)) \leftarrow \text{Associativity of addition} \\ &= 0v + 0 \leftarrow \text{Def'n of additive inverses} \\ &= 0v \leftarrow \text{Def'n of additive identity.} \end{aligned}$$

Proof

$$\begin{aligned} a0 &= a(0+0) \\ &= a0 + a0 \end{aligned}$$

$$\begin{aligned} \text{Hence, } 0 &= a0 + (-a0) \\ &= (a0 + a0) + (-a0) \\ &= a0 + (a0 + (-a0)) \\ &= a0 + 0 \\ &= a0. \end{aligned}$$

(Same reasons as before!)

$(-1)v = -v$ for every $v \in V$.

Proof For $v \in V$,

$$\begin{aligned} v + (-1)v &= (1)v + (-1)v \\ &= (1+(-1))v \\ &= 0v \\ &= 0 \end{aligned}$$

Hence, by the uniqueness of additive inverses,
 $(-1)v = -v$.
